

## Solid Liquid Gas

Sort the properties and examples of a solid, liquid, and gas and glue them correctly.

SOLID	LIQUID	GAS

# Solid Liquid Gas

<p>It does not have a definite shape or a definite volume.</p>	<p>Examples: wood and brick</p>	<p>The force of attraction between molecules is practically non-existent.</p>
<p>Examples: oxygen and hydrogen</p>	<p>The force of attraction between molecules is pretty moderate.</p>	<p>It is highly compressible.</p>
<p>It is only slightly compressible.</p>	<p>Molecules are very loosely packed, resulting in a free-flowing and abundant intermolecular space.</p>	<p>Molecules are closely packed, with no intermolecular space between the particles.</p>
<p>Molecules are loosely packed, allowing for a moderate intermolecular space.</p>	<p>It is incompressible.</p>	<p>It has a definite shape and a definite volume.</p>
<p>It has a definite volume but not a definite shape. It takes the shape of the container.</p>	<p>The force of attraction between molecules is incredibly high.</p>	<p>Examples: milk and oil</p>
