Predators and Prey

In the wild world of animals, there's a delicate balance between predators and prey. Predators are animals that hunt other animals for food, while prey are the animals

to grab rodents, snakes, or even fish. Wolves are smart predators. They hunt in packs and can catch animals like deer or rabbits using teamwork and strategy. Dolphins are like the playful predators of the ocean. They're super swimmers and use their speed and teamwork to hunt fish.

Now, think about being a rabbit in a meadow or a deer in the forest. These animals are called prey. They must be alert and quick to avoid being caught by

Predators and Prey

predators. Rabbits are small and fast. They use their big ears to hear if a predator is approaching and can hop away in the blink of an eye. Deer have excellent eyesight. They can spot predators like coyotes from far away and escape by leaping gracefully through the woods. Gazelles are like the speedy race cars of the animal world. They can run very fast to escape from lions and cheetahs.

an eye out for these incredible creatures and appreciate the beauty of the predator-prey relationship in the wild!

Predators and Prey

1) What is a predator? Give an example.

_____

_____

2) What is prey? Give an example.
