_____ through volcanic eruptions.

Rocks are broken down into small fragments known as _____
by a process called _____. Weathering does not involve the
movement of sediments. Rocks also experience _____, which
breaks the rock down and carries the sediments away. These two processes are
usually performed by natural agents like wind and rain.

Rock Cycle

When sediments stack up on top of each other in layers, they become tightly packed together, undergoing _____. Some minerals may fill the gaps between the sediments, making them stick together in a process called _____. Compaction and cementation of sediments lead to the formation of _____ rocks.
